EXP.NO:1(a)	BASIC C PROGRAMMING-PRACTICE
DATE:	

QUESTION:

Given two numbers, write a C program to swap the given numbers.

For example:

Input	Result
10 20	20 10

PROGRAM:

```c
#include<stdio.h>

int main()
{
    int a, b, t;

    scanf("%d %d", &a, &b);

    t=a;

    a=b;

    b=t;

    printf("%d %d", a, b);

    return 0;
}
```

2116231801181

OUTPUT:

	Input	Expected	Got	
✔	10 20	20 10	20 10	✔

EXP.NO:1(b)	
DATE:	**BASIC C PROGRAMMING-PRACTICE**

QUESTION:

Write a C program to find the eligibility of admission for a professional course based on the following criteria:

Marks in Maths >= 65

Marks in Physics >= 55

Marks in Chemistry >= 50

Or

Total in all three subjects >= 180

Sample Test Cases

Test Case 1

Input

70 60 80

Output

The candidate is eligible

PROGRAM:

```c
#include<stdio.h>

int main()
{
   int m,p,c;

   scanf("%d %d %d",&m,&p,&c);

   int t=m+p+c;

   if(m>=65 && p>=55 && c>=50){

      printf("The candidate is eligible");
   }
   else if(t>=180){

      printf("The candidate is eligible");
   }
   else{

      printf("The candidate is not eligible");
```

2116231801181

```
    }
}
```

2116231801181

OUTPUT:

	Input	Expected	Got	
✔	70 60 80	The candidate is eligible	The candidate is eligible	✔
✔	50 80 80	The candidate is eligible	The candidate is eligible	✔

EXP.NO:1(c)	
DATE:	**BASIC C PROGRAMMING-PRACTICE**

QUESTION:

Malini goes to BestSave hyper market to buy grocery items. BestSave hyper market provides 10% discount on the bill amount B when ever the bill amount B is more than Rs.2000.
The bill amount B is passed as the input to the program. The program must print the final amount A payable by Malini.

Input Format:
The first line denotes the value of B.

Output Format:
The first line contains the value of the final payable amount A.

Example Input/Output 1:

Input:
1900

Output:
1900

Example Input/Output 2:

Input:
3000

Output:
2700

PROGRAM:

```
#include<stdio.h>
int main(){
    int c, t;
    scanf("%d",&c);
    if(c>2000){
        t=c-(c*0.1);
    }
    else{
        t=c;
    }
    printf("%d",t);
}
```

2116231801187

OUTPUT:

	Input	Expected	Got	
✔	1900	1900	1900	✔
✔	3000	2700	2700	✔

EXP.NO:1(d)	BASIC C PROGRAMMING-PRACTICE
DATE:	

QUESTION:

Baba is very kind to beggars and every day Baba donates half of the amount he has when ever a beggar requests him. The money M left in Baba's hand is passed as the input and the number of beggars B who received the alms are passed as the input. The program must print the money Baba had in the beginning of the day.

Input Format:

The first line denotes the value of M.
The second line denotes the value of B.

Output Format:

The first line denotes the value of money with Baba in the beginning of the day.

Example Input/Output:

Input:

100
2

Output:

400

PROGRAM:

```c
#include<stdio.h>

int main(){
    int m, b;
    scanf("%d", &m);
    scanf("%d", &b);
    int t=m*b;
    printf("%d", t*2);
}
```
2116231801187

OUTPUT:

	Input	Expected	Got	
✔	100 2	400	400	✔

QUESTION:

The CEO of company ABC Inc wanted to encourage the employees coming on time to the office. So he announced that for every consecutive day an employee comes on time in a week (starting from Monday to Saturday), he will be awarded Rs.200 more than the previous day as "Punctuality Incentive". The incentive I for the starting day (ie on Monday) is passed as the input to the program. The number of days N an employee came on time consecutively starting from Monday is also passed as the input. The program must calculate and print the "Punctuality Incentive" P of the employee.

Input Format:

The first line denotes the value of I.
The second line denotes the value of N.

Output Format:

The first line denotes the value of P.

Example Input/Output:

Input:

500
3

Output:

2100

PROGRAM:

```c
#include<stdio.h>
int main(){

    int a,d;

    scanf("%d",&a);

    scanf("%d",&d);

    int t=0;

    for(int i=0;i<d;i++)
    {
        a=a+200;

        t=t+a;
```

2116231801187

```
    }
    printf("%d",t-600);
}
```

2116231801187

OUTPUT:

	Input	Expected	Got	
✔	500 3	2100	2100	✔
✔	100 3	900	900	✔

EXP.NO:1(f)	BASIC C PROGRAMMING-PRACTICE
DATE:	

QUESTION:

Two numbers M and N are passed as the input. A number X is also passed as the input. The program must print the numbers divisible by X from N to M (inclusive of M and N).

Input Format:

The first line denotes the value of M
The second line denotes the value of N
The third line denotes the value of X

Output Format:

Numbers divisible by X from N to M, with each number separated by a space.

Boundary Conditions:

1 <= M <= 9999999
M < N <= 9999999
1 <= X <= 9999

Example Input/Output 1:

Input:
2
40
7

Output:
35 28 21 14 7

PROGRAM:

```c
#include<stdio.h>
int main()
{
    int m,n,x;
    scanf("%d\n%d\n%d",&m,&n,&x);
    for(int i=n;i>=m;i--){
        if(i%x==0){
            printf("%d ",i);
        }
    }
}
```

	DIVIDE AND CONQUER
DATE:	

PROBLEM STATEMENT:

Given an array of 1s and 0s this has all 1s first followed by all 0s. Aim is to find the number of 0s. Write a program using Divide and Conquer to Count the number of zeroes in the given array.

Input Format

   First Line Contains Integer m – Size of array

   Next m lines Contains m numbers – Elements of an array

Output Format

   First Line Contains Integer – Number of zeroes present in the given array.

PROGRAM:

```c
#include <stdio.h>

int main() {

    int m, i; scanf("%d",

    &m); int arr[m];

    for(i = 0; i < m; i++) {

        scanf("%d", &arr[i]);

    }

    int low = 0, high = m - 1, mid, firstZeroIndex = -1; while(low

    <= high) {

        mid = low + (high - low) / 2;

        if ((mid == 0 || arr[mid - 1] == 1) && arr[mid] == 0) { firstZeroIndex

            = mid;

            break;

        }

        if (arr[mid] == 1) {

            low = mid + 1;

        } else {         high = mid - 1;

        }
```

EXP.NO:3(c)	DIVIDE AND CONQUER
DATE:	

PROBLEM STATEMENT:

Given a sorted array and a value x, the floor of x is the largest element in array smaller than or equal to x. Write divide and conquer algorithm to find floor of x.

Input Format

   First Line Contains Integer n – Size of array

   Next n lines Contains n numbers – Elements of an array

   Last Line Contains Integer x – Value for x

Output Format

   First Line Contains Integer – Floor value for x

PROGRAM:

```
#include <stdio.h>

int main() {

    int n, x;

    scanf("%d", &n);

    int arr[n];

    for (int i = 0; i < n; i++) {

        scanf("%d", &arr[i]);

    }

    scanf("%d", &x);

    int left = 0, right = n - 1;

    int floor = -1;

    while (left <= right) {

        int mid = left + (right - left) / 2;

        if (arr[mid] == x) {

            floor = arr[mid];
```

[Type here]

```c
            break;
        }
        if (arr[mid] < x) {
            floor = arr[mid];
            left = mid + 1;
        }
        else {
            right = mid - 1;
        }
    }
    if (floor != -1) {
        printf("%d\n", floor);
    } else {
        printf("No floor value found for %d in the array.\n", x);
    }
    return 0;
}
```

EXP.NO:3(d)	
	DIVIDE AND CONQUER
DATE:	

PROBLEM STATEMENT:

Given a sorted array of integers say arr[] and a number x. Write a recursive program using divide and conquer strategy to check if there exist two elements in the array whose sum = x. If there exist such two elements then return the numbers, otherwise print as "No".

Note: Write a Divide and Conquer Solution

Input Format

  First Line Contains Integer n – Size of array

  Next n lines Contains n numbers – Elements of an array

  Last Line Contains Integer x – Sum Value

Output Format

  First Line Contains Integer – Element1

  Second Line Contains Integer – Element2 (Element 1 and Elements 2 together sums to value "x")

PROGRAM:

```
#include <stdio.h>

int main() {

  int n, x;

  scanf("%d", &n);

  int arr[n];

  for (int i = 0; i < n; i++) {

    scanf("%d", &arr[i]);

  }

  scanf("%d", &x);

  int left = 0, right = n - 1;

  int found = 0;

  while (left < right) {
```

[Type here]

```c
        int sum = arr[left] + arr[right];

        if (sum == x) {

            printf("%d\n", arr[left]);

            printf("%d\n", arr[right]);

        f ound = 1;
break;
        }

        if (sum < x) {

            left++;

        } else {

            right--;

        }

    }

EXP.NO:4(a)	1-G-COIN PROBLEM
DATE:	

QUESTION:

Write a program to take value V and we want to make change for V Rs, and we have infinite supply of each of the denominations in Indian currency, i.e., we have infinite supply of { 1, 2, 5, 10, 20, 50, 100, 500, 1000} valued coins/notes, what is the minimum number of coins and/or notes needed to make the change.

Input Format:

Take an integer from stdin.

Output Format:

print the integer which is change of the number.

Example Input :

64

Output:

4

Explanaton:

We need a 50 Rs note and a 10 Rs note and two 2 rupee coins.

PROGRAM:

```
#include <stdio.h>

int min_coins_and_notes(int V) {

    int denominations[] = {1000, 500, 100, 50, 20, 10, 5, 2, 1};

    int n = sizeof(denominations) / sizeof(denominations[0]);

    int count = 0;

    for (int i = 0; i < n; i++) {

        if (V == 0) {

            break;

        }

        count += V / denominations[i];
```

[Type here]

V %= denominations[i];

```c
    return count;
}
int main() {
    int V;
    scanf("%d", &V);
    printf("%d\n", min_coins_and_notes(V));
    return 0;
}
```

EXP.NO:4(b)	2-G-COOKIES PROBLEM
DATE:	

QUESTION:

Assume you are an awesome parent and want to give your children some cookies. But, you should give each child at most one cookie.

Each child i has a greed factor g[i], which is the minimum size of a cookie that the child will be content with; and each cookie j has a size s[j]. If s[j] >= g[i], we can assign the cookie j to the child i, and the child i will be content. Your goal is to maximize the number of your content children and output the maximum number.

Example 1:

Input:

3

1 2 3

2

1 1

Output:

1

Explanation: You have 3 children and 2 cookies. The greed factors of 3 children are 1, 2, 3.

And even though you have 2 cookies, since their size is both 1, you could only make the child whose greed factor is 1 content.

You need to output 1.

Constraints:

1 <= g.length <= 3 * 10^4

0 <= s.length <= 3 * 10^4

1 <= g[i], s[j] <= 2^31 – 1

PROGRAM:

#include <stdio.h>

#include <stdlib.h>

[Type here]

```c
int compare(const void *a, const void *b) {

    return (*(int *)a - *(int *)b);

}

int findContentChildren(int g[], int gSize, int s[], int sSize) {

    qsort(g, gSize, sizeof(int), compare);

    qsort(s, sSize, sizeof(int), compare);

    int childIndex = 0;

    int cookieIndex = 0;

    while (childIndex < gSize && cookieIndex < sSize) {

        if (s[cookieIndex] >= g[childIndex]) {

            childIndex++;

        }

        cookieIndex++;

    }

    return childIndex;

}

int main() {

    int gSize, sSize;

    scanf("%d", &gSize);

    int *g = (int *)malloc(gSize * sizeof(int));

    if (g == NULL) {

        fprintf(stderr, "Memory allocation failed\n");

        return 1;

    }

    for (int i = 0; i < gSize; i++) {

        scanf("%d", &g[i]);

    }
```

EXP.NO:4(c)	3-G-BURGER PROBLEM
DATE:	

QUESTION:

A person needs to eat burgers. Each burger contains a count of calorie. After eating the burger, the person needs to run a distance to burn out his calories.

If he has eaten *i* burgers with c calories each, then he has to run at least $3^i * c$ kilometers to burn out the calories. For example, if he ate 3

burgers with the count of calorie in the order: [1, 3, 2], the kilometers he needs to run are $(3^0 * 1) + (3^1 * 3) + (3^2 * 2) = 1 + 9 + 18 = 28$.

But this is not the minimum, so need to try out other orders of consumption and choose the minimum value. Determine the minimum distance

he needs to run. Note: He can eat burger in any order and use an efficient sorting algorithm.Apply greedy approach to solve the problem.

Input Format

First Line contains the number of burgers

Second line contains calories of each burger which is n space-separate integers

Output Format

Print: Minimum number of kilometers needed to run to burn out the calories

Sample Input

3
5 10 7

Sample Output
76

PROGRAM:

```c
#include <stdio.h>

EXP.NO:5(b)	PLAYING WITH CHESSBOARD
DATE:	

QUESTION:

Ram is given with an n*n chessboard with each cell with a monetary value. Ram stands at the (0,0), that the position of the top left white rook. He is been given a task to reach the bottom right black rook position (n-1, n-1) constrained that he needs to reach the position by traveling the maximum monetary path under the condition that he can only travel one step right or one step down the board. Help ram to achieve it by providing an efficient DP algorithm.

Example:
Input
3
1 2 4
2 3 4
8 7 1
Output:
19

Explanation:
Totally there will be 6 paths among that the optimal is
 Optimal path value:1+2+8+7+1=19

Input Format
First Line contains the integer n
The next n lines contain the n*n chessboard values
Output Format

Print Maximum monetary value of the path

PROGRAM:

```c
 #include <stdio.h>
#define MAX 100

QUESTION:

Problem statement:

Find the length of the Longest Non-decreasing Subsequence in a given Sequence.

Eg:

Input:9

Sequence:[-1,3,4,5,2,2,2,2,3]

the subsequence is [-1,2,2,2,2,3]

Output:6

PROGRAM:

```
#include <stdio.h>
int longest_non_decreasing_subsequence(int arr[], int n) {
    int dp[n];
    int max_length = 1;
    for (int i = 0; i < n; i++) {
        dp[i] = 1;
    }
    for (int i = 1; i < n; i++) {
        for (int j = 0; j < i; j++) {
            if (arr[j] <= arr[i]) {
                dp[i] = (dp[i] > dp[j] + 1) ? dp[i] : dp[j] + 1;}}
        if (dp[i] > max_length) {
            max_length = dp[i];
```

[Type here]

```c
        }

    }

    return max_length;

}

int main() {

    int n;

    scanf("%d", &n);

    int arr[n];

    for (int i = 0; i < n; i++) {

        scanf("%d", &arr[i]); }

    int result = longest_non_decreasing_subsequence(arr, n);

    printf( "%d\n", result);

    return 0;

}
```

[Type here]

OUTPUT:

	Input	Expected	Got	
✔	9 -1 3 4 5 2 2 2 2 3	6	6	✔

QUESTION:

Find Duplicate in Array.

Given a read only array of n integers between 1 and n, find one number that repeats.

Input Format:

First Line - Number of elements

n Lines - n Elements

Output Format:

Element x - That is repeated

For example:

Input	Result
5 1 1 2 3 4	1

PROGRAM:

```c
#include <stdio.h>

int findDuplicate(int arr[], int n) {

    int slow = arr[0];

    int fast = arr[arr[0]];

    while (slow != fast) {

        slow = arr[slow];

        fast = arr[arr[fast]];
```

[Type here]

```c
        }
        fast = 0;
        while (slow != fast) {
            slow = arr[slow];
            fast = arr[fast];
        }
        return slow;
    }
    int main() {
        int n;
        scanf("%d", &n);

QUESTION:

Find the intersection of two sorted arrays.

OR in other words,

Given 2 sorted arrays, find all the elements which occur in both the arrays.

Input Format

·   The first line contains T, the number of test cases. Following T lines contain:

1.   Line 1 contains N1, followed by N1 integers of the first array

2.   Line 2 contains N2, followed by N2 integers of the second array

Output Format

The intersection of the arrays in a single line

Example

Input:

1

3 10 17 57

6 2 7 10 15 57 246

Output:

10 57

Input:

1

6 1 2 3 4 5 6

2 1 6

Output:

1 6

For example:

Input	Result
1 3 10 17 57	10 57

Input	Result
6 2 7 10 15 57 246	

PROGRAM:

```c
#include <stdio.h>
void findIntersection(int arr1[], int n1, int arr2[], int n2) {
    int i = 0, j = 0;
    while (i < n1 && j < n2) {
        if (arr1[i] < arr2[j]) {
            i++;
        } else if (arr2[j] < arr1[i]) {
            j++;
        } else {
```

[Type here]

```c
            printf("%d ", arr1[i]);

            i++;

            j++;

        }

    }

    printf("\n");

}

int main() {

    int T;

    scanf("%d", &T);
    while (T--) {

    int n1, n2;

EXP.NO:6(e)	**PAIR WITH DIFFERENCE-O(N^2)TIME COMPLEXITY,O(1) SPACE COMPLEXITY**
DATE:	

QUESTION:

Given an array A of sorted integers and another non negative integer k, find if there exists 2 indices i and j such that A[j] - A[i] = k, i != j.

Input Format:

First Line n - Number of elements in an array

Next n Lines - N elements in the array

k - Non - Negative Integer

Output Format:

1 - If pair exists

0 - If no pair exists

Explanation for the given Sample Testcase:

YES as 5 - 1 = 4

So Return 1.

For example:

Input	Result
3 1 3 5 4	1

[Type here]

PROGRAM:

```c
#include <stdio.h>

int findPairWithDifference(int arr[], int n, int k) {
    int i = 0, j = 1;
    while (i < n && j < n) {

    int diff = arr[j] - arr[i]; if (i
    != j && diff == k) {
            return 1;
        }
        else if (diff < k) {
